NEW! Buchwald Phosphine Ligands for C-C, C-N, and C-O Bond Formation

Sigma-Aldrich is pleased to offer an array of phosphines for C-C, C-N, and C-O bond formation.

The impact of cross-coupling methodologies to form C-C bonds is paramount in organic synthesis.¹ Of these, Suzuki-Miyaura coupling is among the most powerful transformations available as it enjoys broad scope and wide functional group tolerance.² To this end, notable advances have been made in the laboratories of Prof. Stephen Buchwald at MIT. Sigma-Aldrich is proud to offer a series of Buchwald Ligands successfully utilized in processes including Suzuki-Miyaura coupling, amination, amidation, enolate arylation, Sonogashira coupling and C-O bond formation (Table 1) While each ligand has documented utility, recent work has shown that application of dimethoxy-substituted ligand 1, S-Phos, leads to a Pd-catalyst system with unprecedented scope, reactivity,

and stability for Suzuki-Miyaura coupling processes.³ Selected examples shown in Table 2 illustrate the success of this system with respect to aryl chloride substrates, the generation of truly hindered biaryls, and heteroaryl cross-couplings.

Recently, triisopropyl-substituted ligand 2, X-Phos, has emerged with key applications to Pd-catalyzed C-N bond formation.⁴ Table 3 gives examples which typify the expanded scope of this process utilizing X-Phos. X-Phos has also been successfully applied to Suzuki-Miyaura couplings with arene and vinyl sulfonates⁵ (Table 2), as well as Sonogashira coupling of alkynes⁶ (Table 4). 2-Di-*t*-butylphosphino-2',4',6'-triisopropyl ligand has been found to be a superior ligand for Pd-catalyzed coupling of phenols with aryl bromides and chlorides.⁷

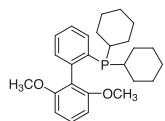

Buchwald Phosphine Ligands (Table 1)

2-Dicyclohexylphosphino-2',6'-dimethoxybiphenyl (S-Phos)

63,807-2

C₂₆H₃₅O₂P

(NEW)

1g

5g

25g

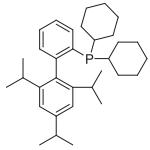

- Highly universal ligand for Suzuki-Miyaura coupling; aryl chlorides, hindered biaryls, generation of heterobiaryls.¹
- Utilized in synthesis of key intermediate enroute to catalytic asymmetric total synthesis of quinine and quinidine.¹¹

2-Dicyclohexylphosphino-2',4',6'-triisopropylbiphenyl, 97% (X-Phos)

63,806-4

C₃₃H₄₉P

(NEW)

1g

5g

25g

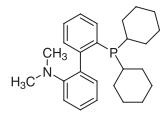

- Increased scope of Pd-catalyzed amination and amidation via arene sulfonates, aryl halides.⁴
- Suzuki-Miyaura coupling of arene, vinyl sulfonates.⁵
- Enolate arylation.⁵
- Sonogashira coupling of alkynes.⁶

2-Dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, 97% (DavePhos)

63,802-1

C₂₆H₃₆NP

(NEW)

1g

5g

25g

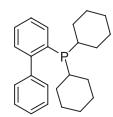

- Amination of aryl halides containing hydroxyl, amide, or enolizable ketone groups.⁸

2-(Dicyclohexylphosphino)biphenyl, 97% (Cyclohexyl JohnPhos)

63,809-9

C₂₄H₃₁P

(NEW)

1g

5g

25g

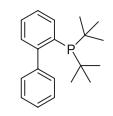

- Amination of aryl halides and triflates.⁹
- Amination of aryl halides containing hydroxyl, amide, or enolizable ketone groups.⁸

2-(Di-*t*-butylphosphino)biphenyl, 97% (JohnPhos)

63,843-9

C₂₉H₂₇P

(NEW)

1g

5g

25g

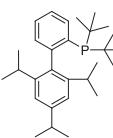

- Amination of aryl halides and triflates.⁹
- Intramolecular C-O bond formation.¹⁰

2-Di-*t*-butylphosphino-2',4',6'-triisopropylbiphenyl, 97% (*tert*-Butyl X-Phos)

63,808-0

C₂₉H₄₅P

(NEW)

1g

5g

25g

- Superior ligand for Pd-catalyzed coupling of phenols with aryl chlorides and bromides.⁷
- C-O bond formation; o-glycosylation using glycals.¹²

Additional Phosphines from Sigma-Aldrich

Sigma-Aldrich offers an extended variety of phosphines utilized in C-C bond forming processes. Recent work reported by Prof. Gregory Fu and coworkers has expanded the utility of trialkylphosphines and

has demonstrated the interchangeability of the corresponding air-stable tetrafluoroborate salts with the parent phosphines in a broad spectrum of C-C coupling processes.¹³

Tricyclohexylphosphine

Pd-Catalysts with Perfluoroalkyl Ponytails: Suzuki couplings under fluorous biphasic conditions

The new *Fluka Fluorous Biphasic Catalysis, Kit I: C-C-Coupling* contains perfluorotagged Pd-catalysts and solvents for up to 10 different catalytic reactions under fluorous biphasic conditions. To get acquainted with this innovative FBS-technology our kit provides detailed descriptions of procedures for two C-C-coupling reactions (Suzuki and Stille coupling), all substrates and reagents necessary for these two model reactions, and 8 additional preparations. Analytical methods and spectra are also given as references. FBS technology allows the catalyst to be easily recovered and to be used for further syntheses.

Reagents for the Mitsunobu Reaction

One of the most powerful and widely used carbon–carbon bond forming reactions in organic synthesis is the Mitsunobu reaction.¹ The Mitsunobu reaction is also useful in the preparation of other moieties, such as

N-alkylamides or imides.² Sigma-Aldrich offers a series of dialkyl azodicarboxylates useful in this well-known reaction.

Proazaphosphatrane: Verkade's Superbases

Sigma-Aldrich is pleased to offer Verkade's Superbases. For a recent survey of the applications of proazaphosphatrane in organic synthesis, see Aldrichimica Acta, 2004, 37(1).

Catalog No.	Product Name	Unit	Price
56,588-1	2,8,9-Triisobutyl-2,5,8,9-tetraaza-1-phosphabicyclo[3.3.3]undecane [Triisobutyl-Verkade's Superbase]	1g	180.00
		5g	
55,695-5	2,8,9-Triisopropyl-2,5,8,9-tetraaza-1-phosphabicyclo[3.3.3]undecane [Triisopropyl-Verkade's Superbase]	1g	180.00
		5g	
46,355-8	2,8,9-Trimethyl-2,5,8,9-tetraaza-1-phosphabicyclo[3.3.3]undecane [Trimethyl-Verkade's Superbase]	1g	180.00

Ruthenium-Based Metathesis Catalysts

Sigma-Aldrich is pleased to announce an agreement with Materia, Inc. to exclusively distribute research quantities of Grubbs catalysts and Hoveyda-Grubbs catalysts. For a recent review on cross-metathesis of nitrogen-containing systems and for pertinent references to other systems, see Aldrichimica Acta, 2003, 36(3), 93.

Grubbs Catalyst 1st Generation

57,972-6

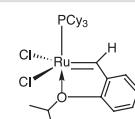

1g

5g

The first metathesis catalyst to be widely utilized in organic synthesis, Grubbs First Generation Catalyst effects ring-closing metathesis, olefin cross-metathesis, and ROMP with high activities and tolerance for functional groups and protic media.^{1,2}

Hoveyda-Grubbs Catalyst 1st Generation

57,794-4

100mg

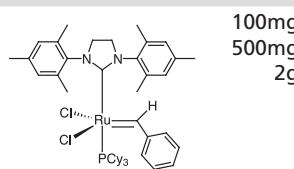

500mg

2g

An efficient, recyclable catalyst for RCM of terminal olefins.^{6,7}

Grubbs Catalyst 2nd Generation

56,974-7

100mg

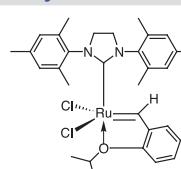

500mg

2g

Grubbs Second Generation Catalyst is a more active analog of the first-generation Grubbs catalyst for ring-closing metathesis, cross metathesis, and ROMP,³ and can lead to trisubstituted olefins via cross metathesis;⁴ it ring-closes olefins with excellent functional-group tolerance and selectivity.⁵

Hoveyda-Grubbs Catalyst 2nd Generation

56,975-5

100mg

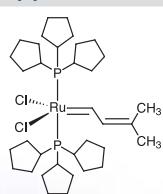

500mg

2g

The Hoveyda-Grubbs Second Generation catalyst shows efficiencies similar to those of second-generation Grubbs catalyst, but with different substrate specificities. The catalyst is unique in catalyzing the ring-closing, ring-opening, and cross-metathesis reactions of highly electron-deficient substrates.^{7,8}

Dichloro(3-methyl-2-butenylidene)bis(tricyclopentylphosphine)ruthenium(II)

57,870-3

Suzuki–Miyaura Coupling Reagents

This brochure contains a comprehensive selection of boronic acids, boronic acid esters, diboron esters, and transition-metal catalysts useful for the Suzuki–Miyaura coupling reaction. New offerings are

added monthly; if you don't see the material you need for your research, please call us at 1-800-231-8327 (USA) or your local office. Your new product suggestions, as always, are welcome and appreciated.

Boronic Acids

Most boronic acids readily undergo dehydration reactions to give a cyclic (trimer) anhydride. Our selection of boronic acids may contain varying amounts of this cyclic anhydride. Fortunately, the acid and

the anhydride work equally well in the Suzuki coupling reactions; thus, the two forms are generally regarded as equivalent.

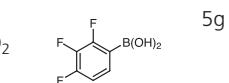

Methylboronic acid, 97%	16,533-6 CH_5BO_2		1g 5g
trans-2-Chloromethylvinylboronic acid	55,659-9 $C_3H_6BClO_2$		1g 5g

Boronic Acid Esters

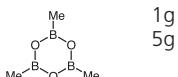

The synthesis of biaryl compounds via the Suzuki–Miyaura coupling reaction has become more commonplace now that many arylboronic acids are readily available. Several years ago, Miyaura et al. demonstrated the utility of cyclic pinacol esters of arylboronic acids

in Suzuki–Miyaura coupling reactions. Aldrich is pleased to offer the following boronic acid esters as part of a growing line of reagents used in the Suzuki–Miyaura coupling reaction.

Diboron Esters

The following diboron esters are versatile reagents that couple with organic triflates and halides to give the corresponding boronic esters, which are used directly or readily converted to arylboronic acids. The subsequent Suzuki–Miyaura coupling reaction can be run under mild

conditions, thus permitting the use of cyano-, ester-, carbonyl-, and nitro-substituted aryl rings. The wide variety of arylboronic acids available via these diboron esters also makes this class of compounds suitable for solid-phase combinatorial studies.

Diboronic Esters

PROFESSOR SUZUKI'S contributions to organoborane chemistry involve the discovery and development of new synthetic methodologies using organoboron compounds. The formation of organic radicals from organoboranes in the presence of catalytic amounts of oxygen was first discovered in the course of cooperative work with Professor Brown's research group.

Professor Suzuki was also instrumental in the utilization of organoboron compounds as carbanions in synthesis. Organoboranes are also useful as a source of carbocations under electrochemical conditions, although a limited number of examples have been reported. More recent work by Suzuki and coworkers revolves around palladium catalyzed cross-coupling reactions of various organoboron compounds with a number of organic electrophiles in the presence of bases. This reaction has become known as the Suzuki Coupling and is the focus of this book.

ALDRICH®

Potassium Trifluoroborates

Alkyl, aryl, and alkenyl trifluoroborate salts are compelling alternatives to boronic acids in Suzuki–Miyaura coupling and in rhodium catalyzed carbon–carbon bond forming reactions. These salts are air and water stable, and in many cases eliminate the need to add either additional ligands or base for cross coupling.

Potassium 3-thiophenetrifluoroborate

Whereas the boronic acids readily form cyclic anhydrides, these new salts do not form unwanted side products. In many cases, the trifluoroborate salt is more efficient and tolerant to functional groups than the corresponding boronic acids.

Bis(pinacolato)diboron

Product No. 47,329-4
CAS # 73183-34-3

- Versatile Reagent for Suzuki–Miyaura Coupling Chemistries
- Air Stable, Easy Handling
- High Quality
- Research and Commercial Scale Capacity
- Superior Value

For more information on how we can fulfill your Bis(pinacolato)diboron needs, contact us at (800)336-9719 or safinechem@sial.com or contact your local SAFC office.

TO ORDER: Contact your local Sigma-Aldrich office (see back cover), call 1-800-558-9160 (USA), or visit sigma-aldrich.com.

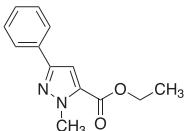

New Biaryl Building Blocks

Aldrich is proud to bring you the following new building blocks. Each month, we will provide a new set of building blocks that are suitable for your medicinal and synthetic chemistry needs. If you require a building block, but do not see it on the list, please contact bseitz@sial.com. To place an order for any of the items below, please call 800-558-9160 (USA) or contact your local Sigma-Aldrich office..
