Filtration & Monitoring Products

Sterility Testing Media and Rinse Fluids

Easy-to-use, reliable, sterile products to ensure accurate sterility testing, bioburden testing and general microbiology preparation

Culture media and rinsing fluids help to highlight the presence of bacteria and fungi. Those products are used mainly to determine whether the pharmaceutical product, medical devices, cream or oil are contaminated by microorganisms.

Test with the Highest Level of Confidence

All our ready-to-use media and fluids are manufactured in ISO® 9001 controlled environments where each lot is certified for pH, sterility, and growth promotion using ATCC® strains specified by the EP 2.6.1, USP 71 et JP 4.06 as well as our strict internal QC procedures. All products are sterile with a Sterility Assurance Level of 10⁻⁶.

Custom Solutions

For specific requests not existing in the current portfolio, we can develop custom solutions fulfilling your specifications. There are some prerequisites to consider, especially about minimum volume: 300 L/batch for bottles and 5000 pcs for tubes and plates. Please contact us in order to start the feasibility study.

Applications

- Sterility testing (membrane filtration and direct inoculation)
- Bioburden testing
- General Microbiology

Multiple Configuration and Features

Our Sterility Testing Media and Rinse Fluids portfolio offer a wide range of products for sterility testing, bioburden testing and general microbiology preparation.

Fluid A

Suitable as a general rinse buffer, and compatible with most samples. Excellent for dissolving or diluting samples, reconstituting commercial microorganisms, or as a transport medium for microorganisms.

Fluid D

Suitable for testing samples that contain lecithin or oil, and compatible with most antibiotics. Excellent for rinsing sterile pathways of devices, and typically needed for rinse method testing of medical devices.

Fluid K

Suitable for testing samples that contain petrolatum, oils, or oily solutions. Excellent for rinsing pathways of medical devices, and for samples that are difficult to filter or dissolve.

Isopropyl Myristate

IPM is suitable as a sterile solvent in water-in-oil emulsion, oils and fat-based ointments. The use of IPM is recommended for sterility testing as a diluent for oils and oily solutions, as well as for ointments and creams. Indeed, its solvent properties improve the filterability of these samples. This product is gamma irradiated.

Fluid Thioglycollate Medium

is primarily intended for the detection of anaerobic bacteria, however, it also enables aerobic bacterial detection. This medium is used for sterility testing by membrane filtration or direct inoculation as described in the USP, EP and JP.

Soybean-Casein Digest Medium

(Trypcase Soy Broth) suitable for the culture of both fungi and aerobic bacteria. This medium is used for sterility testing by membrane filtration or by direct inoculation. It is also used as pre-enrichment broth for non sterile products. Compliant to the USP, EP and JP.

Clear Thioglycollate Medium

has the same growth promotion properties as the standard FTM. The alternative formulation, compliant to pharmacopeia recommendations, brings extra visual clarity.

Double Packaging Configuration

Double packed and ETO sterilized media and fluids for easy use in a laminar flow hood

- Streamline and optimize your cleaning procedures.
- Minimize the risk of cross contamination and false results.
- Reduce the bioburden load on your testing environment.
- Secure an efficient decontamination in isolator chambers.

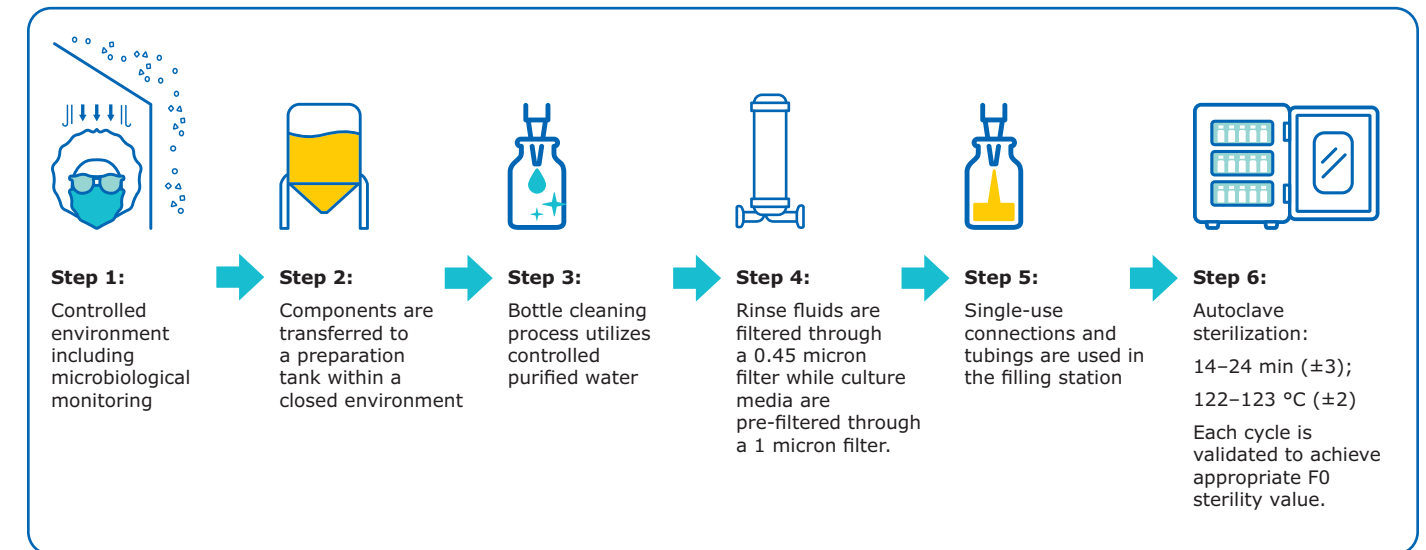

Traceability

- Identification and 2D barcodes on the primary packaging, secondary packaging and on each single unit.
- Color coding on boxes and on each unit to avoid mistakes.

Manufacturing Information

Our manufacturing steps ensure reliable testing

Recommendations

Bottles

- Please inspect each container for visible defects and/or turbidity and discard if present.
- Please avoid the contamination of culture media by contact with skin or body fluids. Such contaminated media cannot be used anymore.
- In the case of negative pressure due to prior heat sterilization, the containers should be ventilated by sterile filter-units (Steritest® vent needles, catalogue no. TEFG02525) before usage to avoid aspiration of potential contaminated air.
- The risk of transfer of microorganisms from the surface of the containers into the sterile culture medium can be minimized by disinfection of the external surface (including the septum) followed by handling in sterile environments (e.g. isolators). The inoculation of the containers by sterile needles is safer than procedures which require opening of media bottles or tubes.

Tubes

- To inject via septum it's optimal to use a cool, sterile, 30 gauge (30G) needle.
- Never inject more than 10% of the total volume of the tube.
- While using a needle with the septum, never touch the medium with the needle when you inject the sample.

Specifications and Ordering Information

Our Sterility Testing Media and Rinse Fluids help to help detect the presence of bacteria and fungi.

These products are used mainly to determine whether the pharmaceutical product, medical devices, cream or oil are contaminated with microorganisms.

The test is passed if no growth is visible at the end of incubation. It is recommended to identify any contaminants to aid in the investigation and to implement any changes or corrective actions.

Bottles

Type 1: Bottle with flip cap with septum. Picture depicts 125 mL bottle with filling volume of 100 mL.

Type 2: Bottle with screw cap with septum. Picture depicts 250 mL bottle with filling volume of 225 mL.

Type 3: Bottle with screw cap with 3 septa. Picture depicts 125 mL bottle with filling volume of 100 mL.

Type 4: Wide mouth bottle. Picture depicts 275 mL bottle with filling volume of 100 mL.

Type 5: Plastic vial with a plastic flip cap. Picture depicts 12 mL vial with filling volume of 9 mL.

Tubes

Tube with screw cap with 2 septa.
